

KYXFI

No token without evidence.

Know Your Asset (KYA): a verification layer for real-asset tokenization on Drunix.

Priyank S. Jani · Founder, KYXFI (an L2Blockchain initiative) · kyxfi.com

THE PROBLEM

Proof behind Indian property is scattered, stale and repeated by hand

State land records

e.g. Gujarat AnyROR, 7/12 extracts

Encumbrance records

Sub-registrar offices, CERSAI

RERA registration

State RERA portals

Company filings

MCA21 for issuer and SPV

Valuation reports

Independent valuers

Issuer documents

Deeds, agreements, statements

Sources disagree, go out of date or are missing. Every investor, platform and lender re-checks them, and the result is never shared or kept current.

A token can be valid while the claim behind it is false

What the ledger proves

- The token exists
- Who holds it
- How it moved
- What the contract allows

What the investor needs

- The parcel exists and is identified
- The issuer holds clean title
- No hidden mortgage or dispute
- The token points to this asset

One Verification Record for every tokenized asset

01

Collect evidence

Land records, encumbrance, RERA, filings, valuation. Every file hashed, with source and date.

02

Correlate and review

Cross-check IDs, names, areas and dates. Screen parties. A reviewer signs off each claim.

03

Publish on Drunix

Claim statuses and the record's hash live on-chain. Minting and sales obey them.

Every claim carries exactly one status

Status	Meaning	Example: Gujarat parcel
Evidenced	Confirmed at an authoritative source	Survey no. matches state land record
Correlated	Consistent across independent sources	Owner name matches deed and MCA
Disclosed	Stated by issuer, not yet confirmed	Rental income per issuer statement
Conflicting	Sources disagree	Transfer dates differ in two records
Unknown	Expected evidence is missing	No encumbrance certificate yet

Four organizations share one KYA record

Smart contracts obey the evidence

UPI purchase checks the asset's KYA status before settlement. Mocked in the prototype; NPCI APIs once access is granted.

A ledger-neutral core, with Drunix as the reference integration

Layer	Technology
Ledger	NPCI Drunix (Hyperledger Fabric fork); chaincode in Go
Backend	Node.js / TypeScript, Fabric Gateway SDK; Supabase (Postgres, storage, auth)
Evidence	OCR + LLM field extraction with human review; SHA-256 hashing
Screening	OFAC, UN and Indian sanctions lists
Payments	UPI integration layer for NPCI APIs (mocked in prototype)
Front end	React, built with Lovable

EXPECTED IMPACT

Trust that lets tokenized real assets scale

Investor protection

See what is proven, disputed or missing before paying

Fraud reduction

No mint on unproven title; live pause on new problems

Lower diligence cost

One shared record replaces repeated manual checks

Regulatory confidence

A standard, auditable disclosure for SEBI, IFSCA and RBI-regulated entities

Drunix adoption

Any tokenization platform on Drunix plugs into KYA

Beyond property

Gold, invoices, infrastructure; GIFT City and UAE

Built by a practitioner, planned in stages

Priyank S. Jani

- 18+ years in distributed systems and enterprise architecture
- ~10 years hands-on blockchain, including Hyperledger Fabric
- Former Head of Engineering; tokenization architecture consultant

No token without evidence.

- NPCI API access to replace the UPI mock
- Citi mentorship on bank and lender use cases
- An introduction to one tokenization pilot on Drunix
